Modulo Operator % → Remainder

$$\text{Dividend} = \text{Divisor} * \text{Quotient} + \text{Remainder}$$

Divisor →

$$\begin{array}{r} 2 \leftarrow \text{Quotient} \\ 4 \overline{) 10} \leftarrow \text{Dividend} \\ - 8 \\ \hline 2 \leftarrow \text{Remainder} \end{array}$$

$$\Rightarrow \text{Remainder} = \text{Dividend} - \underbrace{(\text{Divisor} * \text{Quotient})}$$

highest multiple of
divisor \leq dividend

~~$$\begin{array}{r} 3 \\ 4 \overline{) 10} \\ - 12 \\ \hline -2 \end{array}$$~~

$$\begin{array}{r} 2 \\ 4 \overline{) 10} \\ - 8 \\ \hline 2 \end{array}$$

✓

~~$$\begin{array}{r} 1 \\ 4 \overline{) 10} \\ - 4 \\ \hline 6 \end{array}$$~~

Quiz 1
150 % 11

$$150 - 143 = 7$$

Quiz 2
100 % 7

$$100 - 98 = 2$$

Quiz 3
Pick the largest
-76, -35, -43, -42

Quiz 4

-40 % 7

$$\text{Rem} = -40 - \left\{ \begin{array}{l} \text{greatest multiple} \\ \text{of 7} \end{array} \leq -40 \right\}$$

$$= -40 - (-42)$$

$$= -40 + 42$$

$$= 2$$

35 < -40? No

-35 < -40? No

-42 < -40? Yes

Java = -5
Python = 2 ↗ +7

-80 % 9

$$\text{Rem} = -80 - \left\{ \begin{array}{l} \text{greatest multiple} \\ \text{of 9} \end{array} \leq -80 \right\}$$

$$= -80 - (-81)$$

$$= -80 + 81$$

$$= 1$$

Java = -8
Python = 1 ↗ +9

Quiz 5

$-60 \% 9$

$$\text{Rem} = -60 - \left\{ \begin{array}{l} \text{greatest multiple} \\ \text{of 9} \end{array} \leq -60 \right\}$$

$$= -60 - (-63)$$

$$= -60 + 63$$

$$= 3$$

Java = -6
Python = 3

↗ +9

$$\text{res} = a \% b$$

if (res < 0)

$$\text{res} = \text{res} + b$$

Range

$$\begin{array}{lcl} N \% 10 & \begin{array}{l} \text{Min} = 0 \\ \text{Max} = 9 \end{array} & \Rightarrow \text{Range } [0, 9] \\ \downarrow & & \\ (-\infty, \infty) & & \end{array}$$

$$\begin{array}{ll} N = 100 & 100 \% 10 \rightarrow 0 \\ N = 99 & 99 \% 10 \rightarrow 9 \end{array}$$

$$\begin{array}{lcl} N \% 6 & \begin{array}{l} \text{Min} = 0 \\ \text{Max} = 5 \end{array} & \text{Range } [0, 5] \end{array}$$

$$\begin{array}{lcl} N \% M & \begin{array}{l} \text{Min} = 0 \\ \text{Max} = M-1 \end{array} & \text{Range } [0, M-1] \end{array}$$

Why modulo ?

Modulo operator allows us to get the result in a specific range.

Use cases

1) Dave to Dream \rightarrow Consistent hashing

long
 $- 8 \times 10^{18}$ to
 8×10^{18}

2) Hashmaps / Dictionary

\hookrightarrow Hashing

3) Cryptography

4) Sharding in DBMS

Modular Arithmetic

$$(a + b) \% M = (a \% M + b \% M) \% M$$

Quiz 6

$$\text{Range} = [0, M-1]$$

Example

$$a = 10$$

$$b = 8$$

$$M = 4$$

$$\text{LHS} = (10 + 8) \% 4 = 18 \% 4 = 2$$

$$\text{RHS} = (10 \% 4 + 8 \% 4) \% 4$$

$$= (2 + 0) \% 4$$

$$= (2) \% 4$$

$$= 2$$

Example

$$a = 6$$

$$b = 13$$

$$M = 7$$

$$\text{LHS} = (6 + 13) \% 7 = 19 \% 7 = 5$$

$$\text{RHS} = (6 \% 7 + 13 \% 7) \% 7$$

$$= (6 + 6) \% 7$$

$$= (12) \% 7$$

$$= 5$$

$$(a * b) \% M = (a \% M * b \% M) \% M$$

$$\text{Range} = [0, M-1]$$

Example

$$a = 6$$

$$b = 7$$

$$M = 4$$

$$\begin{aligned} \text{LHS} &= (6 * 7) \% 4 = 42 \% 4 \\ &= 2 \end{aligned}$$

$$\begin{aligned} \text{RHS} &= (6 \% 4 * 7 \% 4) \% 4 \\ &= (2 * 3) \% 4 \\ &= 6 \% 4 \\ &= 2 \end{aligned}$$

$$(a - b) \% M$$

$$(a / b) \% M$$

}

Covered in the
Advanced Batch

Problems

Q1. Given a , n , p . Compute $a^n \% p$.

Note: No inbuilt
functions allowed

Example

$$a = 3$$

$$n = 4$$

$$p = 7$$

$$3^4 \% 7 = 81 \% 7 = 4$$

```
power(int a, int n, int p) {
```

```
    int ans = 1
```

```
    for (i = 1; i <= n; i++) {
```

```
        ans = ans * a
```

```
    }
```

```
    return ans % p
```

```
}
```

Assume no
overflow

TC: $O(N)$
SC: $O(1)$

How to handle the overflow problem?

a = 10
n = 100
p = 30

$$a^n \% p$$

long - 10^{18}

$$10^{100} \% 30$$

```
power(int a, int n, int p) {
```

```
    int ans = 1
```

```
    for(i=1; i<=n; i++) {
```

```
        ans = (ans * a) % p
```

```
    }
```

```
    return ans % p
```

```
}
```

TC: $O(N)$
SC: $O(1)$

$$\text{ans \% } p = \left(\underset{\substack{\text{n times}}}{a * a * a * a * \dots * a} \right) \% p$$

Dry Run

$a, n=5, p, \text{ans}=1$

i	$\text{ans} = (\text{ans} * a) \% p$	ans
1	$\text{ans} = (1 * a) \% p$	$a \% p$
2	$\text{ans} = (a \% p * a) \% p$	$a^2 \% p$
3	$\text{ans} = (a^2 \% p * a) \% p$	$a^3 \% p$
4	$\text{ans} = (a^3 \% p * a) \% p$	$a^4 \% p$
5	$\text{ans} = (a^4 \% p * a) \% p$	$a^5 \% p$

$$\begin{aligned}\text{ans} &= (a \% p * a) \% p \\ &= (a \% p \% p * a \% p) \% p \\ &= (a \% p * a \% p) \% p \\ &= a^2 \% p\end{aligned}$$

Divisible by 3

✓ $789 \rightarrow 7+8+9 = 24$

✗ $8215 \rightarrow 8+2+1+5 = 16$

Sum of all
digits is
divisible by 3

Quiz 7

Which of these numbers is divisible by 3?

$$\begin{array}{r} 4351 \\ \hline 13 \end{array}$$

$$\begin{array}{r} 3521 \\ \hline 11 \end{array}$$

$$\begin{array}{r} 7326 \\ \hline 18 \end{array}$$

$$\begin{array}{r} 8236 \\ \hline 19 \end{array}$$

$$10 \% 3 = 1$$

$$10^2 \% 3 = 1$$

$$10^3 \% 3 = 1$$

$$10^4 \% 3 = 1$$

$$10^n \% 3 = 1$$

Why does this
work?

Property:

$$(a * b) \% m = (a \% m * b \% m) \% m$$

$$(a + b) \% m = (a \% m + b \% m) \% m$$

$$3458 = 3 \times 10^3 + 4 \times 10^2 + 5 \times 10^1 + 8 \times 10^0$$

$$3458 \% 3 = \left(3 \times 10^3 + 4 \times 10^2 + 5 \times 10^1 + 8 \times 10^0 \right) \% 3$$

$$= \left((3 \times 10^3) \% 3 + (4 \times 10^2) \% 3 + (5 \times 10^1) \% 3 + (8 \times 10^0) \% 3 \right) \% 3$$

$$= \left(3 \% 3 + 4 \% 3 + 5 \% 3 + 8 \% 3 \right) \% 3$$

Sum of
digits

$$\Rightarrow (3 + 4 + 5 + 8) \% 3$$

$$= 2$$

$$(3 \times 10^3) \% 3 = (3 \% 3 \times 10^3 \% 3) \% 3$$

$$= (3 \% 3 \times 1) \% 3$$

$$= 3 \% 3$$

$$(4 \times 10^2) \% 3 = (4 \% 3 \times 10^2 \% 3) \% 3$$

$$= (4 \% 3 \times 1) \% 3$$

$$= 4 \% 3$$

Divisible by 4

Last two digits
are divisible
by 4.

Quiz 8

25 424 , 13960 , 44838 , 55552
✓ ✓ ✗ ✓

$$\underline{N = 3294}$$

$$3294 = 3 \times 10^3 + 2 \times 10^2 + 9 \times 10^1 + 4 \times 10^0$$

$$3294 \div 4 = (3 \times 10^3 + 2 \times 10^2 + 9 \times 10^1 + 4 \times 10^0) \div 4$$

$$= \left((3 \times 10^3) \div 4 + (2 \times 10^2) \div 4 + (9 \times 10^1) \div 4 + (4 \times 10^0) \div 4 \right)$$

$$= \left(0 + 0 + (9 \times 10^1) \div 4 + (4 \times 10^0) \div 4 \right)$$

$$= (9 \times 10^1 + 4 \times 10^0) \div 4$$

$$= (94) \% 4$$

← last two digits

$$(3 \times 10^3) \% 4 = (3 \% 4 \times \underline{10^3 \% 4}) \% 4$$

↑
0

$$= 0$$

TODO

- 1) Divisibility rule of 9
- 2) " " " 8

Q. Given 1 number in $\text{arr}[N]$, calculate number % p.

↳ Each digit of the number
is given in $\text{arr}[i]$

$$p = 5$$

$$78962 \% 5 = 2$$

$$3264 \% 5 = 4$$

Constraints

$N =$ No of digits in the number $\leq 10^5$

$$p \leq 10^5$$

$$0 \leq \text{arr}[i] \leq 9 \quad \leftarrow \text{Implied}$$

If

$$N=2$$

Largest number

$$= 10^2 - 1$$

$$N=3$$

$$= 10^3 - 1$$

$$N=4$$

$$= 10^4 - 1$$

$$N=10^5$$

$$= 10^{10^5} - 1$$

$$= 10^{100000} - 1$$

$$\text{arr}[3] = \begin{array}{|c|c|c|c|c|} \hline 3 & 2 & 6 & 4 & 9 \\ \hline \end{array} \% p$$

0 1 2 3 4

$$= (3 \times 10^4 + 2 \times 10^3 + 6 \times 10^2 + 4 \times 10^1 + 9 \times 10^0) \% p$$

$$= ((3 \times 10^4) \% p + (2 \times 10^3) \% p + (6 \times 10^2) \% p + (4 \times 10^1) \% p + (9 \times 10^0) \% p) \% p$$

$$= ((3 \% p \times 10^4 \% p) \% p + (2 \% p \times 10^3 \% p) \% p + (6 \% p \times 10^2 \% p) \% p + (4 \% p \times 10^1 \% p) \% p + (9 \% p \times 10^0 \% p) \% p) \% p$$

x

$a = \text{arr}[i] \% p$

$$x = 1 \% p$$

$$x = (x \times 10) \% p = 10 \% p$$

$$x = (x \times 10) \% p = 10^2 \% p$$

$$x = (x \times 10) \% p = 10^3 \% p$$

Using power equation

$$\text{ans} = (\text{ans} \times a) \% p$$

Put $a = 10$

$$\text{ans} = x$$

Pseudocode

```
int arrayMod(int arr[], int p) {  
    n = arr.length  
    res = 0  
    x = 1  
    for (i = N-1 ; i >= 0 ; i--) {  
        d = arr[i] % p  
        res = (res + (d * x) % p) % p  
        x = (x * 10) % p  
    }  
    return res  
}
```
