

Linked Lists

Linked List data structures be like:

Agenda:

- Object Reference as Data Member
- Why Linked Lists ?
- Size
- Insertion
- Deletion

Classes & Objects

Object Reference as Data Member

```
class Node {  
    int data  
    Node next  
  
    constructor( n ) {  
        data = n  
        next = null / None  
    }  
}
```

$t_1 = \text{new Node}(10)$

$\text{print}(t_1.\text{data}) \rightarrow 10$

$\text{print}(t_1.\text{next}) \rightarrow \text{None}$

$t_1.\text{next} = \underline{\text{new Node}(20)}$

$t_2 = t_1.\text{next}$

$\text{print}(t_2.\text{data}) \rightarrow 20$

$\text{print}(t_1.\text{data}) \rightarrow 10$

$\text{print}(t_1.\text{next}.\text{data}) \rightarrow 20$

$t_2.\text{next} = \text{new Node}(30)$

$\text{print}(t_2.\text{data}) \rightarrow 20$

$\text{print}(t_2.\text{next}.\text{data}) \rightarrow 30$

$\text{print}(t_1.\text{next}.\text{next}.\text{data}) \rightarrow 30$

$\text{print}(t_1.\text{next}.\text{next}.\text{next}) \rightarrow \text{null}$

Q1 Given $N > 0$, create a linked list which contains data from 1 to N.

Example $N = 4$

Nodes having data [2 to N]

```
Node    createLL (int n) {
    Node head = new Node(1)
    Node temp = head
    for(i=2 ; i<=n; i++) {
        temp.next = new Node(i)
        temp = temp.next
    }
    return head
}
```

N=4

$i \rightarrow [2, \overset{\uparrow}{3}, \overset{\downarrow}{4}]$

Q2 Given head Node of a linked list, return its size.

Example

$\Rightarrow 5$

$c = 0 \times 2 \times 3 \times 4 \times 5$

```
int size (Node head) {  
    Node temp = head  
    int c = 0  
    while( temp != NULL) {  
        temp = temp.next  
        c = c + 1  
    }  
    return c  
}
```

Break till 10:13 PM

Q3 Given a head node of a LinkedList, insert a new node at kth index (0 based indexing)

Example 1

$x = 20$

$k = 4$

Node $n = \text{new Node}(x)$

$n.\text{next} = t.\text{next}$

$t.\text{next} = n$

Example 2

$x = 20$

$k = 5$

Node $n = \text{new Node}(x)$

$n.\text{next} = t.\text{next}$

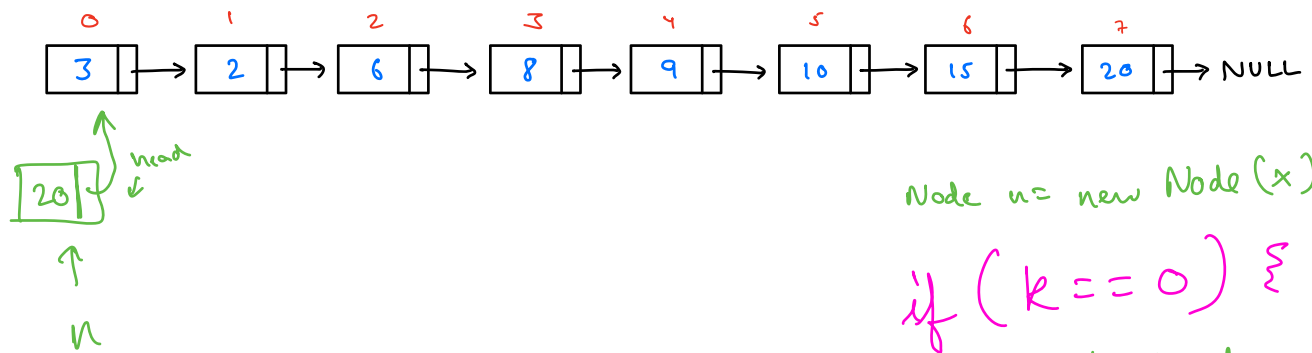

$t.\text{next} = n$

Example 3

$x = 20$

$k = 0$

$\text{Node } n = \text{new Node}(x)$

$\text{if } (k == 0) \{$

$n.\text{next} = \text{head}$

$\text{head} = n$

$\}$

Insertion
at
head

Example 4

7 jumps

$x = 20$

$k = 8$

Node $n = \text{new Node}(x)$

$n.\text{next} = t.\text{next}$

$t.\text{next} = n$

Insertion
at
tail

Example 5

x = 20

k = 9

Q 2

↓

if (k > size(head) or k < 0)

return head

Not
possible

← Return LL
as it is.

k = -10

```

Node insert ( Node head, int pos, int data) {
    if (pos < 0 or pos > size(head)) {
        return head
    }

```

```

    Node n = new Node(x)

```

```

    if (pos == 0) {
        n.next = head
        head = n
        return head
    }

```

```

    Node t = head
    for (i=0; i < pos-1; i++)
        t = t.next

```

← (k-1) jumps

```

    n.next = t.next

```

```

    t.next = n

```

```

    return head

```

```

}

```

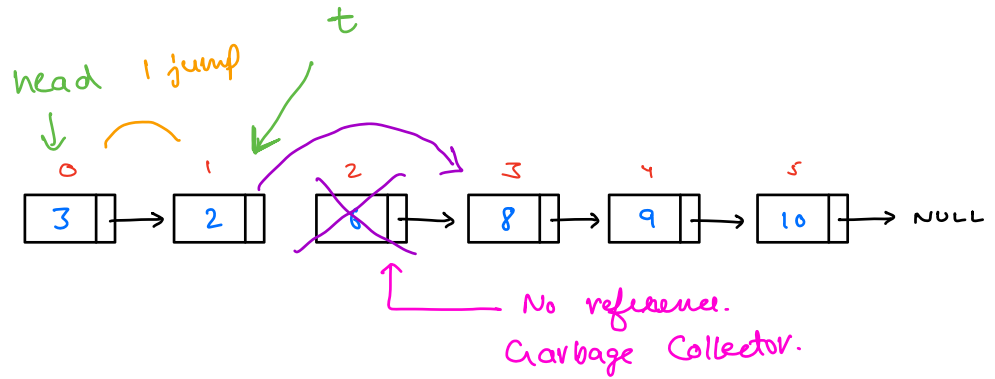

TC: $O(N)$

SC: $O(1)$

Q4 Given a head node of a LinkedList, delete the node at kth index.

Example 1

k = 2

$t.next = t.next.next$

Example 2

k = 5

$t.next = t.next.next$

Example 3

$k = 0$

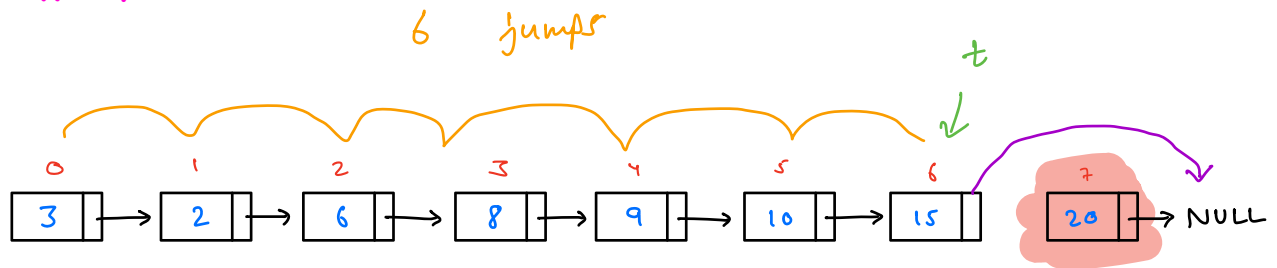

Deletion
at
head

```
if ( $k == 0$ ) {  
    head = head.next  
}
```

Example 4

$k = 7$

$t.next = \frac{t.next.next}{NULL}$

Deletion
at
tail

Example 5

$k = 9$

Not possible

if ($k < 0$ or $k > \text{size}(\text{head})$)

return head;

Node remove(Node head, int pos) {

if (pos < 0 or pos > size(head))
return head

if (pos == 0) {

head = head.next

return head

}

Node t = head

for (i=0; i < k-1; i++)

t = t.next

t.next = t.next.next

return head

(k-1) jumps

}
